EWS is the specialist in fumigation and heat treatment and can treat your cargo against the BMSB!

The brown marmorated stink bug (BMSB) is an agricultural pest native to China, Japan, Korea and Taiwan. Now, the insect is being introduced in the USA, Canada and some parts of Europe. The bug is causing damage to crops, fruits and ornamental trees. At the end of summer, the adult bugs look for shelter in dark and dry places. For example in vehicles and containers. This way, the BMSB rapidly spreads across the world.

### **Treatment methods**

To stop the insects from spreading, Australia and New Zealand have taken measures. These measures being that cargo from certain countries must be treated against the bug. There are two types of treatment: fumigation and heat treatment.

### **EWS: your BMSB specialist**

With our own fumigation areas and heat treatment ovens across Europe we can always find the perfect solution for your valuable freight. EWS is also an approved treatment provider for AQIS and is GTAS-, ISO- and VCA-certified.

For more information about our methods, don't hesitate to contact us:
